Linkedin : [My LinkedIn](#)

Education

2024 – 2026: **MCA** || From [MAKAUT](#) || CGPA – 8.60

2020 – 2023: **B.Sc(Honours) in Computer Science** || From [WBSU](#) || CGPA – 8.30

Skills

Programming : Python, PHP, SQL(mysql), HTML,CSS,JS, $\text{\LaTeX}$ (Basic)

OS : Linux (preferred), windows.

Skill: Excel & LibreOffice, Python Flask , DSA (Basic).

Basic Computer Knowledge.

Projects

Age lable + face + weapon detection in camera

- A python based ML project using keras-facenet and 2 yolo model(download from hugging face), which detect a person's face and age lable and weapon on screen.
- implement in web with flask, we can take face video then train a embbeded model with our face, then this train model help to detect our face.
- also we can detect weapons in camera, if weapon detect then it sand alert and do some actions.

techlogy used: Keras-facenet, yolo model, flask, HTML, CSS, JS.

Hand Sign Language Recognition

- A Python CNN based project, aimed at identifying hand sign posture as alphabet(A-Z, and other signs)
- implemented through taking hand signs as dataset and train them. then predict hand sign with posibility through webcam

techlogy used: Python, Opencv, Keras, Mediapipe.

Disease Prediction by Symptoms

- It's a Python-based machine learning project that predicts diseases from user-provided symptom
- use 665 types of symptoms and 240 type of disease csv data to train model. i use sk-learn's RandomForestClassifier model to train csv data.
- after train and save model then we classify every disease by giving user input. if user symptoms number is big then model prediction score is also gonna high(more data, acurate prediction).
- through python flask we implement a local web for this.

techlogy used: Python, Sklearn, Pandas, Flask.

Road Lane Detection using Sliding Window

- It's a Python and OpenCV based lane detection project that identifies road lane markings using traditional computer vision techniques
- first identify roads, then give a bird view to road. then identify lanes through image thresholding, then make a sliding window of that.
- draw a polygon in between 2 lanes. also include angles by mesuring lane curveture.

techlogy used: Python, OpenCV, Numpy, Matplotlib.
